1. INTRODUCTION

The City of Yuba City, in cooperation with the City of Marysville and the California Department of Transportation (Caltrans), proposes to replace the 5th Street Bridge (Bridge Number 18C-0012) over the Feather River and improve approach roadways to the bridge. The City has obtained authorization for replacement and has initiated project development with Caltrans Local Assistance oversight.

The bridge is rated as "functionally obsolete" by Caltrans under Federal Highway Administration (FHWA) prescribed inspection criteria. This rating is due to inadequate lane and shoulder widths. In addition, traffic forecasts show that intersection and roadway segments at and nearby the bridge will operate at failing levels of service by 2035 and widening of the facility from the existing two lanes to a four-lane structure would provide needed improvements to the transportation network between Yuba City and Marysville. The project would also improve pedestrian and bicycle movements between the two cities over the Feather River.

The Sacramento Area Council of Governments (SACOG) includes the project in their 2035 Metropolitan Transportation Plan (MTP), identifying the need for more capacity over the Feather River between Yuba City and Marysville. The 5th Street Bridge, along with the 10th Street Bridge just to the north, represent the only crossings of the Feather River in a 40 mile reach. In addition, the project is consistent with Yuba City and Marysville General Plans. This proposed project would replace the functionally obsolete bridge, respond to current congestion and improve circulation between the two cities.

Table 1: Summary of Key Project Information

Project Limits 3-SUT/YUB-5TH	Along 5th Street from Bridge Street and Shasta Street in Yuba City to J Street in Marysville, including portions of Bridge Street and 2nd Street in Yuba City and portions of J Street, 3rd Street, and River Front Park in Marysville.
Capital Costs:	$ 58,198,400
Right of Way Costs:	$ 2,355,600
Funding Source:	High Priority Projects (HPP) Regional Surface Transportation Project (RSTP) Highway Bridge Program (HBP) Local Agencies
Number of Alternatives:	Five (5)
Alternative Recommended for Funding	The Recommended Alternative is Alternative 1 – North Alignment, under UPR
Type of Facility (conventional, expressway, freeway):	Urban Major Arterial
Number of Structures:	Two (2)
Environmental Determination/Document	CEQA Initial Study with Proposed Mitigated Negative Declaration (IS/MND) and NEPA Environmental Assessment leading to a Finding of No Significant Impact (FONSI)

2. RECOMMENDATION/PROPOSAL

This report recommends conceptual approval of the project and approval to circulate the Draft Environmental Document for the 5th Street Bridge Replacement Project over the Feather River.

It is recommended the City of Yuba City approve the Build Alternative, described in Section 5, to replace the 5th Street Bridge with a bridge along a northern alignment, which includes four-12 foot travel lanes, a 4 foot median, 8 foot shoulders, and a separated 10 foot wide Class I multi-use trail, as well as improvements to the approach roadways and replacement of the 2nd Street Overcrossing (Bridge No. 18C-0055) in Yuba City

3. BACKGROUND

The 5th Street Bridge is a major arterial connector between Yuba City and Marysville serving local, commercial, commuter, pedestrian, and bicycle traffic. Built in 1958 to replace the previous bridge, which had been destroyed by flood waters in 1955, the prestressed concrete stringer bridge is approximately 1,865 feet long, 42 feet wide, and carries two 12-foot lanes of traffic across the river. A 10-foot Class I pedestrian and bicycle path is located next to the two vehicular lanes on the north side of the bridge.

The existing facility is located between Sutter and Yuba Counties and connects Bridge Street in Yuba City to 5th Street in Marysville. Project limits in the City of Marysville span from 5th and I Street to I and 3rd Street in the south, portions of River Front Park in the west and continuing over the Feather River into the City of Yuba City limits. Project limits within the City of Yuba City include the roadway along 2nd Street, small portions of Sutter, Yolo and Boyd Streets in the south and the western expanse of Bridge Street at the intersection with 2nd Street and terminating just past the intersection at Shasta Street.

A seismic evaluation was prepared in 1992 and a superstructure retrofit was performed in 1994 providing restrainers, transverse and longitudinal keys to the superstructure. In 2008, Sutter County Department of Public Works retained TRC to prepare a Seismic Vulnerability Evaluation and Rehabilitation/Replacement Strategy Report. The report found the bridge to be seismically vulnerable to soil liquefaction and recommended it for replacement due to high retrofit costs and the age of the bridge.

In 2012, the City of Yuba City applied for Highway Bridge Program funding to replace the two lane bridge with a four lane structure following the latest bridge inspection report, which determined the 5th Street Bridge is functionally obsolete due to inadequate lane and shoulder widths. A combination of Local Agency and Federal funds (Highway Bridge Program, Regional Surface Transportation Project, and High Priority Project) have been approved.

The project would also require replacement of the functionally obsolete 2nd Street Overcrossing (Bridge No. 18C-0055) in Yuba City. Due to the proposed alignment of the 5th Street Bridge replacement and the approach roadway on the Yuba City side, the existing 2nd Street Overcrossing does not match the horizontal alignment or profile of the

proposed roadway. Sight distance on 2nd Street and Sutter Street as they approach Bridge Street is currently hindered by the columns and abutment walls of the 2nd Street Overcrossing and UPR underpass, immediately to the south of the overcrossing. The proposed project would improve sight distance at this intersection by removing the existing overcrossing and underpass. While the new 2nd Street Overcrossing would also be a two span bridge with columns in the median, the spans would be longer with sloped embankments at the abutments to improve overall sight distance of approaching vehicles at the intersection. Since UPR has abandoned the section of railroad which crosses the Feather River and 2nd Street in Yuba City, the UPR underpass would not require replacement. Removal of that structure would be permanent.

During preparation of the Draft Environmental Document, two public meetings were held in Yuba City and Marysville to invite community feedback on proposed alternatives. The meetings were well attended by citizens as well as local council and supervisory board members. Comments included a preference for the four lane bridge alternatives that utilized the existing Union Pacific Railroad underpass in Marysville, rather than a structure that would fly over the railroad or a two lane structure along similar alignments.

4. PURPOSE AND NEED STATEMENT

As described in the introduction above, the project is being proposed to remedy two problems associated with the 5th Street Bridge. The bridge is rated functionally obsolete due to inadequate structural design standards and provides inadequate capacity for current and future traffic demands. The need and purpose are discussed further below.

Need:
The existing 5th Street Bridge is rated "functionally obsolete" by Caltrans under FHWA prescribed inspection criteria. Full replacement of the bridge is needed because the current structure does not meet structural design standards. Additional capacity is needed because traffic forecasts show intersection and roadway segments operating at failing levels of service by 2035.

Purpose:
The purpose of the 5th Street Bridge Replacement Project is to replace a functionally obsolete bridge in order to:

- Enhance safety on one of the two major east-west corridors which link Yuba City and Marysville by providing a safer vehicular, pedestrian, and bicycle crossing over the Feather River;
- Provide a transportation facility consistent with Caltrans Standards, as well as local, regional, and statewide plans.
- Improve levels of service by adding two additional lanes across the Feather River.

5. ALTERNATIVES

Several alternatives were developed and considered by the Project Development Team (PDT). The PDT includes staff from the Cities of Yuba City and Marysville, Caltrans District 3, as well as engineering and environmental consultants (Dokken Engineering,

Fehr & Peers Transportation Consultants, and WRECO, see Section 11). Although several build alternatives were considered in the preliminary planning stage, only one build alternative was selected for full analysis in this document. Other alternatives considered were eliminated from further consideration due to greater environmental impacts, public and agency comments, and cost. The Build Alternative is described below, as well as the other alternatives that were eliminated from further consideration.

5A. VIABLE ALTERNATIVES

Build Alternative (Alternative 1)

Description of work to be done includes:

- Construction of a new four-lane bridge over the Feather River;
- Construction of a new four-lane overcrossing over 2nd Street;
- Expansion of 5th Street from two lanes to four lanes between the new bridge and J Street in Marysville, including four lanes under the Union Pacific Railroad underpass;
- Improvements to the 5th Street and J Street Intersection in Marysville including a new eastbound dedicated right turn lane on to J Street and reconstruction of sidewalks and curb ramps to current ADA standards;
- Removal of stop logs on the top of the Marysville levee and construction of a short three foot floodwall extension from the bridge. Installation of a levee cut-off wall through the central portion of the levee;
- Widening of the 5th Street Bridge approach roadway between 2nd Street and Shasta Street in Yuba City, from two lanes to four lanes;
- Realignment of 2nd Street under the overcrossing, construction of raised median, and extension of the left turn lane from 2nd Street to westbound Bridge Street;
- Reconstruction of the eastbound approach to the bridge and removal of the abandoned UPR underpass above the on-ramps;
- Add on-ramp from Sutter Street to westbound 5th Street; and
- Add signalized intersections at the 2nd Street intersections with Bridge Street and the westbound ramps at the intersection of Sutter Street and 2nd Street in Yuba City.

It is anticipated that the maximum depth of excavation would be 15 feet for the pier foundations and 10 feet at the bridge abutments. These excavations are to prepare the location for fill and placement of footings and piles to support the new bridge.

The project includes a Class I multi-use trail over the river with expanded connectivity in Yuba City. This trail would provide pedestrian and bicycle access over the river between Yuba City and Marysville. The Class I trail would be separated from 5th Street by a barrier and would be constructed with a flatter profile than the roadway at the approach into Marysville where the roadway profile grade exceeds 5%.

Minor relocation of utilities is expected on the bridge approach roadways. The new bridge would contain conduits for bridge lighting, communications and future uses. The new bridge may contain a water line connecting the two independent city systems for use in emergency situations.

The connector roadway from 2nd Street (Sutter Street) to westbound Bridge Street would cross the Gilsizer County Drainage District stormwater detention facility. Some roadway embankment would be placed in the southeast end of the basin. The detention capacity lost to the new embankment would be replaced with additional capacity by developing an adjacent basin in the center of the westbound loop off-ramp.

Because of the size of the project and the nature of expanding the crossing from two lanes to four, most of the staging areas are included in the proposed construction footprint. However additional staging areas may be used as necessary for project construction located in the following places: 1) a paved parking area north of the bridge in Riverfront Park and 2) a portion of the old Feather River Mill Site at the southeast corner of Shasta and Bridge Streets. Both of these areas are included in the project area.

No-Build Alternative (Alternative 5)

The No-Build, or "Do Nothing," Alternative would not improve the transportation corridor along Bridge Street between Yuba City and Marysville. The existing bridge would not be replaced and would remain deficient for travel lane and shoulder width concerns.

5B. REJECTED ALTERNATIVES

Alternatives that were considered and rejected by the PDT include:

Alternative 2 proposed to replace the 5th Street Bridge over the Feather River with an alignment north of the existing structure with a two lane bridge and a Class I multi-use trail.

This alternative was rejected based on the need for 4 lane capacity. The adjacent approaches have four lanes and should continue as such for improved traffic operations and safety between Yuba City and Marysville.

Alternative 3 proposed to replace the 5th Street Bridge with a high profile crossing over the Feather River and Union Pacific Railroad. The proposed 4-lane bridge with a Class I multi-use trail would pass 25 feet above the two Union Pacific tracks and then descend into Marysville on a 7.7% grade.

This alternative was rejected because it has the highest cost of the four alternatives studied and that cost is considered by the PDT to be prohibitive. The proposed bridge would be a cast-in-place, post-tensioned, concrete box girder structure 84.5 feet wide and 3,038 feet long. The design requires 1,200 feet to reach grade at Third Street after crossing the UPR tracks and requires 2 full parcel acquisitions. One of the parcels is a historic property used as a Salvation Army Women and Children's Shelter and acquiring the parcel would have many social and historical impacts.

Alternative 4 proposed to replace the 5th Street Bridge over the Feather River with an alignment south of the existing structure. The proposed bridge crossing would have a straighter alignment with the approaching roadways, as well as have a 4-lane design with a Class I multi-use trail. The south alignment would require the removal of the Northern Electric Railroad Bridge, which has been determined a historic resource eligible for inclusion in the National Register of Historic Places. The southern alignment would also impact the Veterans Memorial Park in Yuba City. Both the railroad bridge, as a historic resource, and the park, as a recreational facility, are protected under Section 4(f) of the Department of Transportation Act of 1966.

The alternative was rejected due to the expected substantial impacts to both the historic railroad bridge and the Veterans Memorial Park as Section 4(f) resources. Section 4(f) requires that if a reasonable and feasible avoidance alternative is available, it must be selected over other alternatives that would substantially impact Section 4(f) resources.

Conversion of the Union Pacific Railroad Bridge was considered as an alternative for obtaining two additional lanes for Fifth Street over the Feather River. However, this alternative was rejected based on the costs to convert the existing structure to a highway structure that meets current highway and seismic design requirements. The cost to convert the existing structure is nearly equivalent to the cost of constructing 2 new lanes of the new structure. The bridge was also considered for conversion to a bicycle and pedestrian only facility. Again however, the life cycle cost analysis favored constructing the trail as part of the new bridge.

6. CONSIDERATIONS REQUIRING DISCUSSION

6A. DESIGN CONSIDERATIONS

The proposed design for the Build Alternative balances considerations for connections to existing facilities, current National and State regulations for flood control clearance, bike and pedestrian facilities, structural standards and safety, as well as local considerations for speed, lane and shoulder widths, traffic patterns and connectivity.

The project will connect the existing four-lane roadways of Bridge Street in Yuba City and 5th Street in Marysville, which are currently linked by the two-lane bridge. The posted speed limit in Yuba City along Bridge Street approaching Shasta Street eastbound is 25 miles per hour (mph). Approaching Shasta Street westbound, the speed limit over the bridge is 35 mph and changes to 25 mph at Shasta due to the school zone for Bridge Street Elementary School. The posted speed limit in Marysville in the vicinity of the project is 30 mph.

The proposed project would use a design speed of 45 mph in Yuba City, 40 mph over the bridge, and 35 mph into Marysville as 5th Street crosses under the UPR railroad structure. These design speeds were chosen to balance the following criteria:

- Clearance over the 100-year base flood water surface elevation
- Clearance under the UPR grade separation

- Safety considerations, such as sight distance and horizontal curvature

The Project achieves required clearance over the base flood water surface elevation, as well as clearance over existing levee elevations. The base flood is that flood which has a one percent chance of occurrence in any given year (100-year flood). Potential flooding conditions for the proposed Project were evaluated based on the 100-year floodplains depicted on FEMA Flood Insurance Rate Maps (FIRMs). Based on available data, traffic interruptions due to the base flood would not be present at the Project site because the 100-year base flood is contained in the Feather River channel. The roadway elevation at the bridge is higher than the 100-year and 200-year design flood water surface elevations at the Feather River crossing, which would make it possible to keep the 5th Street Bridge open to emergency traffic in the event of flooding.

The proposed Project meets current UPR regulations, which require 16.5 foot veritcal clearance from roadway surfaces to the soffit of railroad structures. In order to achieve clearance over the Feather River levee and under the existing UPR structure, the design speed used to determine vertical curves and sight distance at the Marysville approach was set at 35 mph. The profile grade has a maximum value of 6.5% for less than 200 feet at the Marysville approach to achieve the transition between the levee and UPR structure. Minimum vertical curve length which provides headlight sight distance in this sag is maintained, thus special lighting at this location is not required.

As the proposed alignment of 5th Street approaches the UPR underpass, the two eastbound travel lanes split to utilize the existing openings in the structure, as depicted in Figure 5 in Section 6C.

6B. REGIONAL AND SYSTEM PLANNING

Regional Transportation Plans

The Sacramento Area Council of Governments (SACOG) is an association of local governments in the six-county Sacramento Region. Its members include the counties of El Dorado, Placer, Sacramento, Sutter, Yolo and Yuba as well as 22 cities in the region. SACOG has been designated by the Governor as the Metropolitan Planning Organization (MPO) for this region. SACOG provides transportation planning and funding for the region, and serves as a forum for the study and resolution of regional issues. In addition to preparing the region's long-range transportation plan, SACOG approves the distribution of affordable housing in the region and assists in planning for transit, bicycle networks, clean air and airport land uses. The project is listed in the 2035 SACOG Metropolitan Transportation Plan.

Local General Plans

General Plans are prepared pursuant to state mandates which require every city and county within the state to adopt a comprehensive, long-term general plan for the physical development of the community and lands located inside its boundary, which in the planning agency's judgment, bears a relation to its planning. Additionally, General Plans establish a comprehensive document which can improve coordination of community development activities among all units of government. The proposed project's Build Alternative would be consistent with the General Plans from both Yuba City and Marysville. The No-Build Alternative would not be consistent as it would not improve conditions for safety, circulation, aesthetics, levels of service, and balancing future development with system circulation.

Emergency Services

Yuba City is served by the Yuba City Fire Department and Yuba City Police Department for emergency services. Marysville is served by the Marysville Fire Department and Marysville Police Department for emergency services. Both cities receive paramedic services from the Fire Department and local hospital ambulances. All of the above listed emergency services use the 5th Street Bridge for access between the two cities.

The proposed project would have no adverse effects on emergency response planning, emergency access and risk exposure. The increased capacity on the new bridge (four lanes) would relieve traffic congestion and allow for faster emergency response times. Project features, such as the addition of sidewalks, bike lanes and generally improved ADA access, would improve safety for pedestrians and bicyclists.

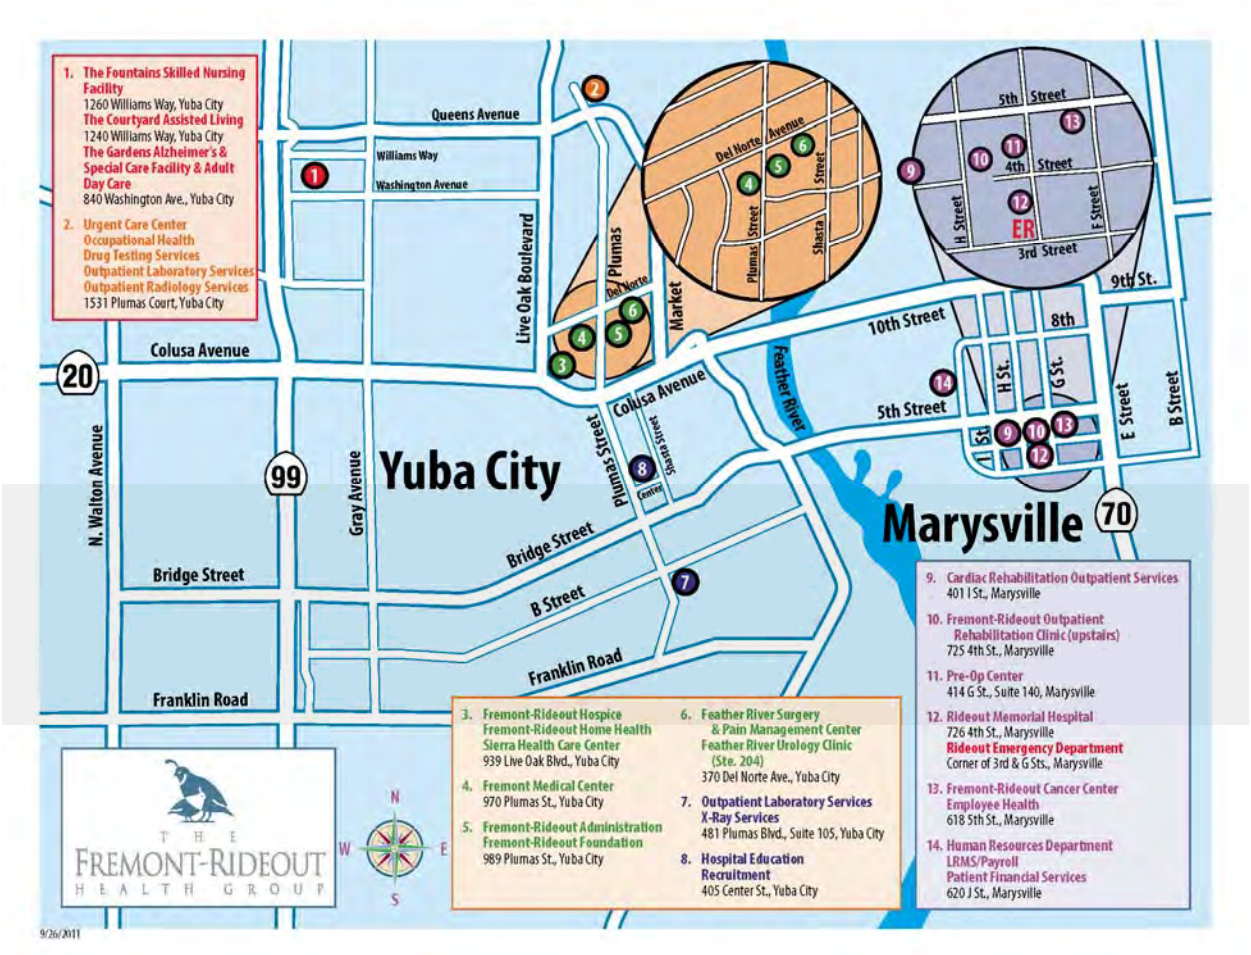
Traffic congestion and delays can occur during construction; however, these effects can be avoided through standard traffic management planning which may include timely notification of any lane closures to police and fire departments, the California Highway Patrol and other emergency service providers. The project has been designed to ensure that access across the 5th Street Bridge will remain open throughout construction. The new bridge will be built in stages such that two lanes on the new bridge will be built and opened for traffic prior to closure and demolition of the existing bridge. The 3rd and 4th lanes would then be constructed and the full width bridge would be opened to traffic. This will ensure that emergency services will retain full access between the two cities for the entirety of the construction period.

Under the No Build Alternative, the existing condition would not change and would therefore have no effect on emergency services.

Regional Hospital Access

Rideout Health Group operates two local medical centers in the Yuba-Sutter community. Figure 1 shows the relative locations of services in the Yuba City and Marysville area compared to the roadway network and the two limited river crossings. Fremont Medical Center is located in Yuba City on Plumas Street north of Colusa Avenue (SR-20), approximately one mile from the project. Rideout Memorial Hospital is located in Marysville on 4th and G Streets, approximately 0.33 miles from the project. Currently under construction, Rideout Regional Medical Center is expected to open in January 2015, near the existing site of Rideout Memorial Hospital, and will be the premier regional hospital for Yuba and Sutter Counties and surrounding Cities. As discussed above, police, fire, and emergency responders use 5th Street Bridge to respond to emergencies and to access the hospital and future medical center. The proposed project would improve access to the regional hospital network.

Figure 1: Rideout Health Group Regional Hospital Network



Source: Rideout Health Group, www.frhg.org, March 2013

Regional Transit

Figure 2 displays the existing transit routes in Yuba City and Marysville, which are operated by Yuba-Sutter (Y-S) Transit. There are currently no transit routes that use the 5th Street Bridge, due to the typical potential for congestion on the link. However, portions of the 5th Street/Bridge Street corridor are served by the Yuba City Loop (Route 2), with stops near Plumas Street and Gray Avenue. Y-S Transit would consider adding scheduled bus service routes on a new 4-lane 5th Street Bridge crossing. Y-S Transit also offers dial-a-ride services, which are not confined to the route map and would benefit from less congestion on the 5th Street Bridge as they transport clients from both counties to the medical center in Marysville.

6C. TRAFFIC AND CORRIDOR IMPACTS

The *Traffic Report for the 5th Street Bridge Replacement Project Study Report/Project Report* (Fehr & Peers 2011) was prepared in conformance with methodologies that were developed in coordination with Caltrans, Yuba City, and Marysville. Traffic impacts were analyzed, along the Bridge Street/5th Street corridor, based upon the effects from area-wide development and general population growth. Development included both the proposed project and nearby future projects. Traffic counts were collected and an AM and PM peak hour analysis was performed for the following intersections, listed here and shown in Figure 3.

1. Bridge Street/SR 99
2. Bridge Street/Gray Avenue
3. Bridge Street/Clark Avenue
4. Bridge Street/Cooper Avenue
5. Bridge Street/Plumas Street
6. Bridge Street/Shasta Street
7. Bridge Street/5th Street Eastbound On-Ramp
8. 5th Street Westbound Off-Ramp/Sutter Street

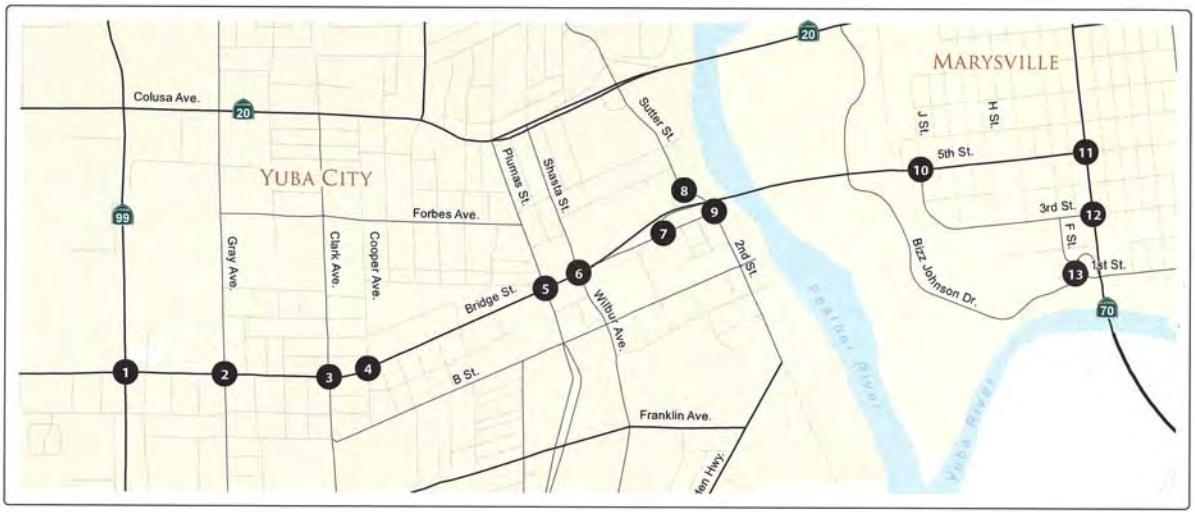
12. 3rd Street/SR 70
13. SR 70 Southbound On-Ramp/F Street

Figure 3: Existing Intersections Analyzed for Traffic Impacts



Source: Fehr & Peers, Traffic Study 2011

Existing Traffic Facilities

The 5th Street Bridge is a two-lane bridge that spans the Feather River. It is situated approximately 1/3-mile downstream from the four-lane SR 20 Bridge (the other major connector between Yuba City and Marysville). The 5th Street Bridge is elevated above Sutter Street, the Feather River, Riverfront Park, and Biz Johnson Drive for a total length of nearly a half mile. The bridge has a posted speed limit of 35 miles per hour (mph).

Bridge Street begins west of SR 99 and extends in an east-west direction through Yuba City, terminating at 2nd Street. An on-ramp from eastbound Bridge Street forms the beginning of the 5th Street Bridge. Westbound motorists on the 5th Street Bridge connect directly with Bridge Street. East of SR 99, Bridge Street has four lanes and a posted speed limit of 35 mph with the exception of the 1,900-foot segment of Gray Avenue to Cooper Avenue, which has two lanes and a posted speed limit of 25 mph. Bridge Street provides access to predominately commercial uses as well as an arterial connection with SR 99.

5th Street begins east of SR 70 and extends in an east-west direction through Marysville, becoming the 5th Street Bridge. Between SR 70 and 3rd Street, it is a four-lane undivided roadway with a posted speed limit of 30 mph. 5th Street provides access to a mixture of commercial and residential uses in the surrounding area as well as an arterial connection with SR 70.

The traffic analysis examined the bridge and roadway connecting the two cities, ramp junctions, and the intersection operations under the existing conditions. The 13 study intersections all currently operate at acceptable levels of service (LOS) with the exception of the Bridge Street/2nd Street intersection (LOS E operations during PM peak hour). Table 2 shows existing LOS at the 13 intersections in the project area.

Vehicle Queuing

Vehicle queues were observed throughout the study corridor. In most instances, maximum queues remained within the available turn lane storage. However, several notable exceptions were observed:

- Northbound SR 70 left turn lane at 5th Street: The northbound left-turn lane features 150 feet of vehicle storage. Field observations reveal that vehicle queues regularly spill out of the turn pocket and into the 3rd and 4th Street intersections.

- Eastbound 5th Street through/right at J Street: The eastbound approach consists of a single lane at the UPRR trestle bridge (375 feet west of the intersection), and then widens to three lanes at the J Street intersection. Vehicles were observed to regularly queue back to the trestle bridge and beyond.

- Bridge Street between Clark Avenue and Cooper Avenue: This segment of Bridge Street has one lane in each direction. The traffic signals at Clark Avenue and Cooper

Avenue are situated about 470 feet apart. This close spacing causes traffic to occasionally spill back from one intersection to the other.

Bottleneck Locations

Field observations and travel time runs revealed the following bottleneck locations along the study corridor:

- Eastbound: Bottleneck locations include the single through lane on Bridge Street from Gray Avenue to Cooper Avenue, imbalanced lane usage at the Plumas and Shasta Street intersections (inside through lane more heavily used in anticipation of accessing the 5th Street Bridge on-ramp), and the 5th Street Bridge merge (located east of the on-ramp).

- Westbound: Bottleneck locations include the heavy left-turn movements on northbound SR 70 at 3rd Street and 5th Street, the merge point just west of the 5th Street/J Street Intersection, and the single through lane on Bridge Street from Cooper Avenue to Gray Avenue.

- 5th Street/J Street Intersection: Causes moderate delays and queuing, but is not currently a major bottleneck in the corridor.

These locations do not necessarily "meter" or limit the amount of traffic that is able to travel through the corridor. Rather, they are locations known to cause increases in delays, which may potentially be affecting motorists' choice of travel route.

Circulation Consideration along Bridge Street

The eastbound on-ramp to the Fifth Street Bridge has been retained at the current mid-block location between Boyd Street and Yolo Street. This was done intentionally to ensure that Boyd Street would not be selected as an alternative to Shasta Street for vehicles heading eastbound on Fifth Street. If the Fifth Street on-ramp was aligned with Boyd Street, it would attract vehicles into Boyd Street attempting to avoid the Shasta/Fifth Street intersection. Also, for vehicles coming from Second Street and heading eastbound on Fifth Street, the selected mid-block location results in a shorter path of travel.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities, such as sidewalks, in the project area are located on 5th Street, Bridge Street, and several other adjacent roadways in Yuba City and Marysville as sidewalks. The existing bridge also has a Class I separated 10-foot wide path for bicycle and pedestrian use. The path over the bridge connects with other paths on the Yuba City side associated with the levee. Some of these connections are lacking ADA access. Intersections in the project area predominantly include crosswalks.

Accident and Safety Information

Although the existing facilities have not reported accident data in excess of state or federal averages, the existing two lane bridge does pose a substantial problem for accident safety. During an accident event, or even a simple breakdown, the bridge becomes a gridlock and poses access challenges for responding emergency or tow-truck vehicles. Clearing accidents on the bridge usually requires full closure of the bridge to deal with the emergency situation.

Table 2: Level of Service for Existing Intersection Conditions

Intersection		Jurisdiction (Minimum Acceptable LOS)	Control	Peak Hour	Existing Conditions	
					Delay (sec/veh)	LOS
1	Bridge Street / SR 99	Caltrans (E)	Traffic Signal	AM	34	C
				PM	53	D
2	Bridge Street / Gray Avenue	Yuba City (D)	Traffic Signal	AM	25	C
				PM	40	D
3	Bridge Street / Clark Avenue	Yuba City (D)	Traffic Signal	AM	29	C
				PM	41	D
4	Bridge Street / Cooper Avenue	Yuba City (D)	Traffic Signal	AM	32	C
				PM	36	D
5	Bridge Street / Plumas Street	Yuba City (D)	Traffic Signal	AM	35	D
				PM	39	D
6	Bridge Street / Shasta Street	Yuba City (D)	Traffic Signal	AM	17	B
				PM	32	C
7	Bridge Street / 5th Street On-Ramp	Yuba City (Exempt)	Side Street Stop	AM	12	B
				PM	19	C
8	5th Street WB Off-Ramp / Sutter Street	Yuba City (Exempt)	Side Street Stop	AM	19	C
				PM	14	B

				PM	24	C

Notes: Intersection delay is based on the average intersection control delay for signalized and all-way stop controlled intersections. The worst case movement is reported for side-street stop controlled intersections

Bold text indicates unacceptable operations.

General Plan Policy 5.2-I-12 permits the Yuba City Council to exempt intersections 7 and 8 from a LOS standard because they are associated with the 5th Street Bridge Crossing

Source: Fehr & Peers, Traffic Study 2011

Environmental Consequences

The traffic study assumed an opening year of 2015 and design year of 2035 for the project when modeling future traffic conditions. Based on the projected model, traffic levels on the 5th Street Bridge (average of AM and PM peak hours) are projected to increase by 24% over existing conditions by 2015. Furthermore, if the Build Alternative is selected, and a new four-lane bridge is constructed, traffic levels on the 5th Street Bridge are expected to increase by 40% over existing conditions. These growth rates are explained by the theoretical capacity of a two-lane versus a four-lane bridge. Essentially, as congestion increases traffic will use alternative routes to save time, but with additional capacity and lower levels of service under a four-lane condition, more vehicles will use the facility. These projected traffic growth values on the Bridge Street/5th Street corridor are shown in Table 3.

Average Daily Traffic (ADT) on the 5th Street Bridge is estimated to be 32,800 under existing conditions and is projected to increase to 40,700 in 2015 and 66,500 in 2035 under a No-Build Alternative. The traffic study indicates that six of the thirteen intersections will operate at unacceptable LOS in 2015 (opening year) and ten out of thirteen would operate at unacceptable LOS in 2035 (not including the two exempt intersections) if improvements are not made (Tables 4 and 5).

Table 3: Projected Traffic Growth on Bridge Street/5th Street Corridor

Segment	Bi-Directional Traffic Volume					
	Existing Conditions		Design Year No-Build Alternative		Design Year Build Alternative	
	AM Peak	PM Peak	AM Peak	PM Peak	AM Peak	PM Peak

Build Alternative

The traffic study prepared for this project includes an analysis of traffic conditions in the opening year (2015) as well the design year which is 20 years after opening (2035). The intersection operation results are presented in Tables 4 and 5.

With implementation of the Build Alternative, traffic operations in the project area as well as on the local and regional interstate network would improve. The LOS at the modeled intersections would be generally better in both the opening year and design year compared with the No-Build Alternative. Although, the Build Alternative would double the existing capacity of the bridge, the peak hour congestion related benefits would only be realized for a portion of this additional capacity, since the opening of four lanes would divert traffic away from the SR 20 crossing of the Feather River to the north. The congestion relief benefits are more clearly identified in the opening year, where the Build Alternative would reduce the number of intersections with a failing LOS from six to two.

By the design year, even with the project, most of the modeled facility would be overwhelmed with traffic as Table 5 shows 12 out of 13 intersections operating at a LOS E or F during peak hour. Additional capacity over the Feather River is a goal of the Yuba City and Marysville General Plan Transportation and Circulation Elements, and by 2035, it is possible that additional capacity beyond this project will be added between the two cities. Additionally, as illustrated in Table 5, the average delay would be reduced with the Build Alternative compared with the No-Build Alternative for the majority of intersections.

The Build Alternative would improve facilities for bicycles and pedestrians. The new bridge would have a similar Class I multi-use path; however, roadway work on the adjacent project areas within Yuba City and Marysville would include improvement and addition to the existing sidewalk and bicycle path systems. Additional connections with ADA compliant access will be provided between the Class I trail over the bridge and the existing trails located on and adjacent to the Yuba City levee. Formalized crosswalks will be added as necessary at each of the affected intersections throughout the project, and in general, pedestrian and bicycle safety would be enhanced by the project.

In order to accommodate the additional two lanes of traffic over the Feather River, permanent tie in connections with the bridge would be required for both Yuba City and Marysville sides of the project. At the Marysville side, the additional two lanes will travel underneath the existing railroad overhead bridge which passes over 5th Street just west of J Street, shown in Figure 4.

Table 4: Intersection Operations – Opening Day (2015) Conditions

Intersection		Jurisdiction (Minimum Acceptable LOS)	Control	Peak Hour	No Build Alternative		Build Alternative	
					Delay (sec/veh)	LOS	Delay (sec/veh)	LOS
1	Bridge Street / SR 99	Caltrans (E)	Traffic Signal	AM	42	D	43	D

Source: Fehr & Peers, Traffic Study 2011

Figure 4: Existing 5th Street Condition under the Railroad Bridge

This new widened connection with the 5th Street and J Street intersection will require additional features to ensure traffic safety. In order to prevent collision with the existing underpass columns, concrete barriers and crash guards will be implemented on the west side of the railroad bridge for eastbound lanes as they pass under the railroad bridge, depicted in Figure 5. As shown on Attachment K, the concrete barrier and crash guard will extend past the column of Pier 4 to protect on coming westbound traffic, as well. Solid white striping is proposed to prevent last minute lane changes as motorists approach the intersection. However, future measures may include additional flexible delineators to provide additional deterrence. The other legs of the 5th Street and J Street intersection will be improved, widened, or restriped as needed to accommodate the additional improvements and lanes of traffic across the bridge.

On the Yuba City side of the bridge, the proposed project would include removal of the two existing bridges over 2nd Street. These structures include the 5th Street roadway bridge over 2nd Street and the abandoned railroad bridge over 2nd Street. Removal of these bridges would improve sight distance at the adjacent intersections on Sutter Street and 2nd Street north and south of the crossings, respectively. The intersection of Bridge Street and 2nd Street, as well as the intersection with the 5th Street on/off-ramp and Sutter Street will be upgraded to signalized intersections.

Figure 5: Proposed 5th Street Condition under the Railroad Bridge

From Shasta Street to the bridge approach, 5th Street will be widened to allow eastbound traffic direct access to the bridge. The existing eastbound on-ramp will be removed, along with the abandoned RR underpass. Bridge Street, east of Shasta Street, will be accessed by an off-ramp-type connection to avoid a lane conflict with westbound traffic. Vehicles using Bridge Street between Boyd Street and 2nd Street will now need to take an alternative route to go westbound. Access from this area to eastbound 5th Street will use a new redesigned on-ramp, which will allow a longer acceleration and merge length for improved safety.

The Build Alternative is expected to degrade traffic conditions at the Bridge Street/SR 99 intersection during the PM peak hour. The additional delay is due to a 15 percent increase in traffic that will utilize the intersection during the peak hour. In order to reduce this potential traffic impact, the project has been designed to include a right-turn overlap arrow on the westbound Bridge Street approach to SR 99 and modify the traffic signal progression plans to better manage traffic flows. These changes should minimize the potential impacts caused by the project through the design year; however, these identified impacts are likely to be further minimized, in the near term, by upstream bottlenecks which will meter the amount of traffic able to access the intersection during peak hour conditions. These proposed changes will be made prior to completion of construction and are signalization changes only, no ground disturbance or construction is necessary.

During construction of the Build Alternative, accessibility for vehicles, bicycles and pedestrians may be affected. Travel lane and/or sidewalk closures may occur during various phases of construction, resulting in detours and temporary traffic delays associated with the construction period.

No Build Alternative

The traffic operations analyses for the No Build Alternative are presented in Tables 4 and 5 for intersections, and indicate deficiencies under existing and future conditions. Nearly all intersections in and around the project area would operate in worse congestion conditions under the No Build Alternative in 2015 and traffic conditions are expected to continue to worsen through 2035. The No Build would be inconsistent with the General Plans of both Yuba City and Marysville to establish additional transportation capacity over the Feather River.

Under the No Build Alternative, no improvements would be constructed for bicycle and pedestrian facilities. Accessibility and connectivity would remain deficient in the project area. The No Build Alternative would not modify existing traffic patterns for residents and businesses. Under the No Build Alternative, improvements would not be constructed; therefore, construction period effects to the transportation system do not apply to this alternative.

6D. VALUE ANALYSIS

A value analysis (VA) for the project was conducted in March 2011 over a four day period. The VA team was directed to use Option 1 (Build Alternative) as the baseline proposed project and looked at design alternatives that addressed the following functions: 1) Improve Traffic Operations, 2) Increase Capacity and 3) Reduce Maintenance.

Several design alternatives will still be reviewed with bridge type selection. The following recommendation has already been accepted in the design:

V.A. Alternative No. 2: Reduce median width from 6' to 4'.

This concept would reduce overall bridge costs and provides for the design speed consistent with the approach roadways. With reduced shoulder width, it will discourage motorists from speeding. Other benefits include a smaller footprint, less R/W, and less environmental impact. This alternative has a potential cost savings of $1.0 million and a performance increase of 9%.

6E. RIGHT OF WAY ISSUES

The proposed project would have right of way impacts to several adjacent properties. See Attachment G for Right of Way Exhibits of affected properties. Acquisitions will be performed by the City with Caltrans oversight. Acquisitions of temporary construction easements and permanent right of way are necessary for the Build Alternative.

In Yuba City, the project would impact private property, as well as public properties owned by Sutter County, the City of Yuba City, and the Gilsizer County Drainage District. Additionally, existing public utility easements are affected. The private property will require partial property acquisition. As partners in the development of the 5th Street Bridge Replacement Project, Sutter County and Yuba City would cooperate in the reassignment of public properties for the purpose of public roadway right of way.

In Marysville, there are three nonresidential, single business retail establishments that will be impacted by right of way acquisitions of two parcels under the Build Alternative. These acquisitions occur on J Street south of 5th Street. All three of the businesses will require relocation assistance and full acquisitions of the underlying property. Table 6 identifies the parcels impacted by full acquisitions under the Build Alternative.

Table 6: Full Acquisitions

APN	Area Impacted (sf)	Nonresidential Single Business Retail	Estimated Costs (Acquisition & Relocation Assistance)
YUB 010-156-006	10,827	California Check Cashing Store	$600,000
YUB 010-156-005	14,770	7 to 7 Smog and Hague Water	$600,000
Total	**25,597**		**$1,200,000.00**

APN = Assessor's Parcel Number, sf = square feet

Any business that moves from real property, moves personal property from real property as a result of the acquisition of the real property, or is required to relocate as a result of a written notice from a lead agency for a transportation project is eligible for "Relocation Assistance". All activities will be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended. Relocation resources shall be available to the displacees in compliance with Title VI and State statute, after eligibility has been determined.

Additionally, the Build Alternative would have impacts to Union Pacific Railroad right of way. See Section 7 for discussion of Union Pacific Railroad Involvement.

Utilities

In Yuba City, potable water and wastewater are managed and operated by the Yuba City Public Works Department, Utilities Division. Yuba City draws water directly from the Feather River. The City of Marysville potable water is managed and provided by the California Water Service Company, Marysville District. The California Water Service Company draws groundwater through eight wells and conveys it to Marysville via pipeline. The City of Marysville Public Services Department manages the wastewater systems within the city.

Pacific Gas and Electric Company (PG&E) provides the area with electric and natural gas services. There are existing electrical lines on power poles in Marysville and Yuba City. Power lines are found at 5th Street in Marysville and at 2nd Street and Bridge Street in Yuba City. There is an electrical line spanning Riverfront Park and Feather River located on poles and towers north of the existing 5th Street Bridge. There is also a cable communication line spanning the river and park on the abandoned Northern Electric Railroad Bridge just south of the 5th Street Bridge. Table 7 outlines a preliminary list of utilities that are expected to be located within the project area.

Table 7: Existing Utility Facilities

Utility Company	Description of Utility Facility	Utility Location
AT&T	Telecommunication	Existing 5th Street Bridge and underground in the roadway approaches
Comcast	Overhead Fiber Optic and other Telecommunication Lines	J Street and 4th Street, crossing over the Feather River on the Railroad Bridge, and continuing onto Bridge Street.
Pacific Gas and Electric	Overhead Electrical Lines and Underground Natural Gas Pipelines	Along 5th Street, crossing the Feather River north of the 5th Street Bridge and continuing on Bridge Street.
California Water Service	Water Main	5th Street and J Street
Levee District One	Underground Unknown Facilities	Within the West Yuba City Levee
Marysville Levee District	Underground Unknown Facilities	Within the East Marysville Levee
City of Yuba City	Sewer Mains and Storm Drains	5th Street and J Street
City of Marysville	Sewer and Water Lines,	Under various roadways

	Storm Drains	throughout the Project Area in Yuba City
Gilsizer Drainage District	Storm Drainage Facilities	Yuba City approach

Build Alternative

AT&T telecommunication lines, and potentially other communication lines using AT&Ts duct banks under lease agreement, are located on the existing 5th Street Bridge and will need to be relocated in a similar duct bank on the new bridge. Comcast fiber optic and telecommunication lines are located on overhead poles which are in conflict with the proposed project and will need to be relocated. PG&E electric lines are located on poles which are in conflict with the project and will need to be relocated. The California Water Service water main located at 5th Street and J Street has above ground appurtenances that will need to be either relocated underground or reconnected above ground during construction. Levee District One and Marysville Levee District have unknown utilities located in the respective levees which may be impacted during construction and may require relocation. The City of Marysville has sewer mains on 5th Street and J Street which may need to be relocated, and the City of Yuba City has sewer and water facilities within the City roadway system that may also require relocation during construction.

Each of these utilities will be located during final project design and full utility coordination, consistent with Caltrans and FHWA requirements, will be performed. All utilities that require relocation during project construction will be moved to another area within the project study area; however, no new environmental impacts of any kind are anticipated as a result of these utility relocations. Any utility relocation required as part of this project has been accounted for in the environmental analysis for the project.

No-Build Alternative

Under the No-Build Alternative, there will be no utility improvements or relocations within the study area.

6F. NOISE ABATEMENT DECISION REPORT

This section represents the Noise Abatement Decision Report (NADR) which:

- Is an evaluation of the reasonableness and feasibility of incorporating noise abatement measures into this project;
- Constitutes the preliminary decision on noise abatement measures incorporated into the Draft Environmental Document (DED); and
- Is required for Caltrans to meet Title 23, Code of Federal Regulation, Part 772 of the Federal Highway Administration standards.

The preliminary Noise Abatement Decision Report (NADR) presents the preliminary noise abatement decision as defined in the Caltrans Traffic Noise Analysis Protocol (Protocol) for the 5th Street Bridge Replacement Project.

The NADR does not present the final decision regarding noise abatement; rather, it presents key information on abatement to be considered throughout the environmental review process, based on the best available information at the time the DED is published.

The preliminary noise abatement decision is based on the feasibility of evaluated abatement and the preliminary reasonableness determination. Noise abatement is considered to be acoustically feasible if it provides noise reduction of at least 5 dBA at receivers subject to noise impacts. Based on the Protocol (May 2011), a base allowance of $55,000 is allotted per benefited residence, to spend on abatement. This reasonable allowance is then compared to the engineer's cost estimate for the abatement. If the engineer's cost estimate is less than the allowance, the preliminary determination is that the abatement is reasonable. If the cost estimate is higher than the allowance, the preliminary determination is that abatement is not reasonable.

Based on the project level Noise Study Report (NSR) (September 2011), only one noise barrier, B1 as shown in Attachment H, is preliminarily considered to be feasible. The noise barrier is 10 feet in height and 170 feet long. The barrier in consideration benefits five residences. Based on the analysis in this report, noise barrier B1 was deemed preliminarily reasonable and is recommended for construction.

Interdisciplinary technical meetings were held to reach the recommendations stated in this document. The barrier that was recommended will be further analyzed within the Environmental Document.

7. OTHER CONSIDERATIONS

7A. STAGE CONSTRUCTION

Construction of the 5th Street Bridge Replacement Project would have temporary impacts on traffic, Feather River fish habitat, and Riverfront Park seasonal activities. To facilitate minimum impacts and maintain general function of the local facilities within the project area, the following Stage Construction is proposed.

Temporary impacts to traffic are unavoidable in the area of the project. However, delays would be minimized by keeping the existing bridge and two lanes of traffic open by use of staged construction. The new 5th Street Bridge over the Feather River and Riverfront Park would be designed with three frames to span the entire 1900 feet from levee to levee. Frames 1 and 2, the west and center portions, would be built to their full width, while Frame 3, the east portion which conflicts with the existing bridge alignment at the Marysville levee, would be staged such that the northern half is built first. The new 2nd Street Overcrossing would also be built in two stages, as it conflicts with the existing 2nd Street Overcrossing. The existing bridge, overcrossing, and approach roadways would remain open to traffic during the first stage of construction. Traffic would then shift to the new structures during the second stage of construction to build the southern half of Frame 3 and the 2nd Street Overcrossing. Adjacent and approach roadways will be staged and/or detoured as necessary to smoothly connect to the new and existing structures.

7B. CONSTRUCTION IMPACTS TO ENVIRONMENTAL RESOURCES

A temporary trestle would be built in order to construct the pier columns in the active channel river bed and support falsework during bridge superstructure construction. Additional areas may be used during construction and dewatering and/or stream diversion may also be required. However, Frame 1 of the 5th Street Bridge, which spans the active channel of the Feather River, would be constructed in one season.

Construction over Riverfront Park would necessitate a temporary closure of a portion of the park in the immediate vicinity of the existing 5th Street Bridge. Construction activities would be contained to an area approximately 150 feet wide along the existing bridge alignment. During construction, all efforts to minimize this temporary impact to the park and its facilities would be taken. Further, no active portion of the park and its facilities will be occupied by construction for more than 6 months. In order to ensure that park activities are not substantially impacted for more than 6 months in any one area, construction staging and construction activities that would impact the recreational use of the park will be done in stages. The exact order of construction would need to be determined by the contractor in coordination with Yuba City.

7C. DRAINAGE

The proposed project drainage and storm event runoff would be handled by directing runoff to existing storm drain systems in both Yuba City and Marysville. Drainage from the 5th Street Bridge would be piped through the interior box girder cells, not removed by scuppers or down-column drains through the deck. Along 5th Street between Shasta Street and the 2nd Street Overcrossing, including the on- and off-ramps, where curb and gutters are not used, natural sheet flow of runoff to the adjacent vegetation will be used. In Marysville, curb and gutter are used on all new roadway segments. Drainage will be directed using gutters, storm drain inlets and pipes to the existing storm drain system.

Gilsizer County Drainage District manages a large drainage basin within the limits of the project area. The basin, on the north side of 5th Street as it approaches Shasta Street in Yuba City, collects storm runoff and other local drainage and transfers it south via an underground culvert to the Gilsizer Slough. Proposed project features, such as widening 5th Street to four lanes and construction of a westbound on-ramp from Sutter Street, would impact the capacity of the Gilsizer basin. During final project design the capacity would be studied and methods to avoid and/or mitigate lost capacity would be evaluated.

7D. UNION PACIFIC RAILROAD INVOLVEMENT

The project would require railroad involvement with Union Pacific Railroad. 5th Street crosses under two UPRR tracks at the 5th Street Underpass. The underpass has a total of 5 openings. Two are for pedestrians and three could be used for vehicular traffic. The travel lanes at the underpass must expand from 2 to 4. See Attachment K for a diagram of the UPRR underpass and associated proposed project features.

An on-site meeting was held on January 13th, 2011 between UPR, City of Yuba City, City of Marysville and the PUC to determine the best solution to expanding the travel lanes. As the existing structure was felt to be in good condition, replacement is

unwarranted. It was determined to utilize the two openings between piers 2, 3 and 4 for eastbound traffic and westbound traffic to use the opening between piers 4 and 5. UPR requested that the piers be protected from vehicle impact.

Additionally, approximately 4100 sf of right-of-way would need to be acquired from UPR to accommodate the free right turn lane the project proposes.

For the project the following items would need to be obtained:

- A PUC GO-88B application would be required to modify the grade separated crossing.
- A "concurrence letter" from UPR would need to be included with the GO-88B application.
- Approval from UPR to perform concrete scanning of the piers and abutments of the underpass and small excavations to identify the width and depth of the pier footings.

8. ENVIRONMENTAL DETERMINATION/DOCUMENT

The City of Yuba City Public Works Department and California Department of Transportation, as assigned by the Federal Highway Administration, have prepared an Initial Study with Proposed Mitigated Negative Declaration/Environmental Assessment, which examines the potential environmental impacts for the proposed project. Yuba City is the California Environmental Quality Act lead agency, while Caltrans is the National Environmental Policy Act lead agency. The document describes why the project is being proposed, what alternatives have been considered for the project, how the existing environment could be affected by the project and the proposed avoidance, minimization, and/or mitigation measures. The cover page of the Draft Environmental Document is included as Attachment N.

9. PROJECT COST AND FUNDING

A project cost estimate was prepared for the 5th Street Bridge Replacement Project. The estimate for the project, as defined by the description of the Build Alternative, includes the total cost of developing, designing, administration, right of way and construction. Table 8 lists the costs by major expense elements, Engineering and Environmental, Construction Contract and Administration, and Right of Way and Utilities. Construction Administration includes the cost for construction management, engineering support during construction, and local agency administration of the contract. Right of Way and Utilities includes the cost for determining the existing condition and conflicts of the private right of way and utilities with the Build Alternative, coordinating relocation plans with the owners, and performing the relocations.

Table 8 also shows the cost separated by HBP Participating and HBP Non-Participating limits. The federal Highway Bridge Program (HBP) has allocated funds for the Preliminary Engineering (PE), Right of Way (R/W), and Construction (CON) phases of the project. HBP funding is designated for costs associated with design and construction of the 5th Street Bridge and 2nd Street Overcrossing replacements, along with limited lengths of approach work. The 5th Street Bridge and 2nd Street Overcrossing are fully

funded by HBP. The HBP participating limits of construction are depicted in the exhibits of Attachment L.

The complete project extends beyond HBP participating limits in Yuba City and Maryville. Road widening and ramp realignment are necessary in Yuba City to connect the new 4-lane bridge to the existing road network. In Marysville, road widening and intersection modification will complete the connection. Table 8 shows how the costs are divided into the Participating and Non-Participating portions.

Table 8: Project Cost Estimate

Project Element	Cost Estimate	HBP Participating	HBP Non-Participating
Engineering & Environmental	$ 4,259,000	$ 3,651,850	$ 607,150
Construction Contract	$ 58,198,400	$ 47,165,300	$ 11,033,100
Construction Administration	$ 4,683,838	$ 4,131,926	$ 551,912
Right of Way/Utilities	$ 2,355,600	$ 222,500	$ 2,133,100
Totals	**$ 69,496,838**	**$ 55,171,576**	**$ 14,325,262**

The 5th Street Bridge Project has received programmed funding allocations from several sources in addition to HBP. The federal High Priority Projects (HPP) program provided the City with a limited scope demonstration grant, which helped to fund the Project Approval/Environmental Document (PA/ED) phase of project development. Regional Surface Transportation Program (RSTP), allocated by SACOG, will be used to supplement some of the construction costs outside the HBP participation limits. Each funding source requires a match of either 20% or 11.47% to be provided by the recipient(s). Table 9 shows the total programmed amounts and the associated match requirements.

Table 9: Project Programming Status

Funding Source	Funding Amount	Required Match
HBP	$ 54,412,414	$ 7,076,588
RSTP	$ 3,500,000	$ 453,462
HPP Demonstration[1]	$ 3,599,600	$ 899,900

[1] HPP Demonstration funds are designated for PA/ED phase of the project and cannot be used for Construction Contract, Construction Administration, or Right of Way and Utilities costs.

The City is seeking funding for the project features beyond the participating HBP limits. After accounting for the RSTP contribution of $3.5 million, the Non-Participating cost is approximately $10.4 million. In addition, it is seeking assistance with the $6.8 million in matching funds to the overall project, including PE, R/W, and CON. The remaining Non-Participating costs as well as the matching fund requirements are shown in Table 10 as Unfunded Costs.

Table 10: Unfunded Cost Estimate

Funding Type	Unfunded Amount
HBP Match [1]	$ 6,328,180
RSTP Match	$ 453,462
Remaining Non-Participating Cost	$ 10,371,800
Totals	**$ 17,153,442**

[1] HBP Match value is 11.47% of the HBP Participating Cost shown in Table 8.

In March of 1990, a joint resolution was adopted by the Counties of Sutter and Yuba and the Cities of Yuba City and Marysville outlining the maintenance responsibilities of each of the jurisdictions related to the bridge. Under this resolution the four jurisdictions are equally responsible for the cost of major maintenance that may be required. The responsibility for any local funds required to complete the bridge replacement project will also be equally shared by each jurisdiction. Any contributions received to offset the Unfunded Amounts shown in Table 10 will therefore directly benefit these four local agencies.

10. SCHEDULE

Milestones	Delivery Date (Month, Year)
Begin Environmental	January 2011
Circulate DED	July 2013
PA & ED	December 2013
Project PS&E	May 2015
Right of Way Certification	August 2015
Advertise for Bid	August 2015
Begin Construction	May 2016
End Project	January 2018

11. PROJECT PERSONNEL

George Musallam	City of Yuba City, Public Works Director
Kevin Bradford	City of Yuba City, Associate Civil Engineer
David Lamon	City of Marysville, City Services Director
Cara Lambirth	Caltrans, Environmental Coordinator
Michael McCollum	Caltrans, Local Assistance Highway Bridge Program
Matthew Griggs	Dokken Engineering, Consultant Project Manager
Tim Chamberlain	Dokken Engineering, Associate Environmental Planner
Megan Carter	Dokken Engineering, Consultant Associate Engineer
John Gard	Fehr and Peers, Consultant Traffic Engineer
Han-Bin Liang	WRECO, Consultant Water Resources Engineer

HIGHWAY BRIDGE PROGRAM (PARTICIPATING)

District-County-Route	03-SUT/YUB-0
PM	N/A
EA	N/A
Program Code	BHLS-5163(025)

PROJECT DESCRIPTION: 5th Street Bridge Replacement Project
Bridge No. 18C0012 & 18C0055

Limits: Along 5th Street from Bridge Street and Shasta Street in Yuba City to J Street in Marysville, including portions of Bridge Street and 2nd Street in Yuba City and portions of J Street, 3rd Street, and River Front Park in Marysville.

Proposed Improvement (Scope): The City of Yuba City, in cooperation with the City of Marysville, proposes to replace the 5th Street Bridge (Bridge # 18C-0012) over the Feather River and improve approach roadways to the bridge. The 5th Street Bridge is a major arterial connector between the two cities serving local, commercial, commuter, pedestrian, and bicycle traffic.

Alternate: **Build Alternative: Alternative 1: 4-Lane North Alignment, under UPR**

CONSTRUCTION CONTRACT WORK

COMMENTS

For each parcel that requires full acquistion the budgeted cost is $500,000 which does not include relocation assistance.
Relocation assistance is budgeted for $100,000 for each parcel.
